

Allocation & In-Stock Tracker

ILLUSTRATIVE SAMPLE DATA — NOT FROM ANY EMPLOYER. Every store, unit and week in this workbook is invented to demonstrate the method.

What it is

An allocation workbook, not a forecast. It does not try to predict what will sell. It takes the inventory that already exists and answers two questions: **where is it wrong, and what should move**. One intimate apparel style across a full bra size range, nine stores, twelve weeks — 2,160 rows of store × size × week. Every figure on the four analysis tabs is a live formula pointed back at that one data tab; nothing is pasted as a value. Built to survive an .xlsx → Google Sheets import, so no pivot tables, no macros, no XLOOKUP, no merged cells.

The four measures, and what each one is for

Measure	How it is calculated	The question it answers
Sell-Through %	Cumulative units sold ÷ cumulative units received, to date	Was the original allocation the right size? Low means too much was sent.
Weeks of Supply	On hand ÷ trailing 4-week average weekly sales	How long does what is in the store last? Puts a small store and a large one on one scale.
In-Stock %	Share of weeks so far that ended with stock on hand	Could the customer actually buy it? Catches the store that sold out early and looks great.
Size-curve variance	Half the sum of the gaps between inventory mix and sales mix	Is the stock in the right sizes? Reads as the share of units sitting in the wrong ones.

What the sample data shows at week 12 (floor 2 weeks, ceiling 12 weeks, curve broken above 20%)

Store	Weeks of supply	Sell-through	In-stock	Size-curve variance	Reading
S01 Toronto - Downtown	1.1	92%	98%	33%	Below the weeks-of-supply floor, size curve broken
S02 Toronto - North	4.4	73%	100%	12%	Healthy
S03 Mississauga	7.4	63%	100%	31%	Size curve broken
S04 Ottawa	4.5	73%	100%	15%	Healthy
S05 Montreal	3.5	78%	100%	19%	Healthy
S06 Quebec City	23.4	34%	100%	9%	Above the ceiling
S07 Calgary	5.7	68%	100%	10%	Healthy
S08 Vancouver	2.2	85%	99%	19%	Healthy
S09 Halifax	12.3	57%	90%	56%	Above the ceiling, size curve broken

The call the workbook makes

17 transfers, 281 units. The buy on this style closed after week 8, so no more inventory is coming — rebalancing between stores is the only lever left. Each line takes the smaller of what the sending store can spare above the 12-week ceiling and what the receiving store needs to reach the 6-week target, and is suppressed entirely below 6 units because the freight is not worth it. Largest six:

Size	From	Its weeks of supply	To	Its weeks of supply	Units
34B	Quebec City	23.1	Toronto - Downtown	0.6	39
34C	Quebec City	24.5	Toronto - Downtown	0.1	37
36B	Quebec City	22.0	Toronto - Downtown	1.0	29
36C	Quebec City	28.9	Vancouver	1.5	25
32B	Quebec City	26.0	Toronto - Downtown	0.8	20
36D	Quebec City	21.3	Toronto - Downtown	0.3	19

Three things the size-curve tab catches that a total-units view does not

- A store can be in stock and still be broken.** Halifax holds 12.3 weeks of cover — barely over the ceiling — and reads 90% in stock. But its variance index is 56%: it was allocated an even spread across all twenty sizes against a demand curve that concentrates in 34B–36C. It is holding units it cannot sell and missing the ones it can.
- Over-stocked is not the same problem as wrong-curve.** Quebec City is the worst store in the fleet on quantity — 23.4 weeks of supply, 34% sold through — but its variance index is only 9%. It was sent the right shape and far too much of it. That is a buy-quantity error, and it is fixed by moving units out, not by re-cutting the curve.
- A starved store hides its own demand.** Toronto Downtown is at 1.1 weeks and 92% sold through. Because it kept running out, its trailing sales rate understates what it could have sold — which shrinks the transfer the sheet recommends it. That is why in-stock % sits beside weeks of supply rather than underneath it.

Every threshold above — the floor, the ceiling, the rebalance target, the minimum shippable quantity and the review week — is a single named cell on the transfer tab. Change one and the whole workbook re-runs. Tab 5 states every formula in plain English.
